

IN THE CLAIMS

A status of all the claims of the present Application is presented below:

1. (currently amended) A network attachable display device, comprising:
a display network interface operable to receive graphics image data of an image over a communication network;
a display frame buffer operable to store said received graphics image data; [and]
~~a display decompression unit coupled to said display frame buffer and operable to decompress said graphics image data; and~~
a display refresh unit operable to read said graphics image data from said display frame buffer, said display refresh unit further operable to display said image on a display unit.
2. (original) The network attachable display device of claim 1, further comprising a display network interface port coupled to said display network interface, said graphics image data being received over said communication network via said display network interface port.
3. (original) The network attachable display device of claim 2, wherein said display network interface port is selected from the group consisting of an Ethernet port, an Infiniband port, and a wireless network transceiver.
4. (canceled)
5. (currently amended) The network attachable display device of claim 1, [further comprising a] ~~wherein the~~ display decompression unit is operable to decompress said graphics image data [into decompressed graphics image data] prior to being stored in said display frame buffer.
6. (original) The network attachable display device of claim 1, said graphics image data being part of a plurality of packets received from a remote source device.

7. (original) The network attachable display device of claim 6, wherein said remote source device is a graphics adapter.

8. (original) The network attachable display device of claim 6, wherein said remote source device is a graphics appliance.

9. (currently amended) A method for displaying an image on a network attachable display device, comprising:
receiving, by a display network interface of said network attachable display device, graphics image data of said image over a communication network;
storing said received graphics image data in a display frame buffer of said network attachable display device;
decompressing said graphics image data by a decompression unit of said network attachable display device;
reading said stored graphics image data from said display frame buffer by a display refresh unit; and
displaying said image on a display unit.

10. (canceled)

11. (original) The method of claim 10, further comprising storing said decompressed graphics image data in said display frame buffer.

12. (original) The method of claim 11, said graphics image data and said decompressed graphics image data being stored in different portions of said display frame buffer.

13. (currently amended) The method of claim 9, [further comprising] wherein decompressing said graphics image data [into decompressed] comprises decompressing said graphics image data prior to storing said graphics image data in said display frame buffer.

14. (original) The method of claim 13, said decompression being performed at a rate at least as fast as a rate at which said image is being displayed on said display unit.

15. (original) A network attachable display device, comprising:
a display frame buffer operable to store graphics image data; and
a network attachable display controller coupled to said display frame buffer, said network attachable display controller comprising:
a display network interface operable to receive graphics image data of an image over a communication network, said display network interface further operable to provide said graphics image data to said display frame buffer;
a display decompression unit operable to decompress said graphics image data into decompressed graphics image data; and
a display refresh unit operable to read graphics image data of said image from said display frame buffer, said display refresh unit further operable to display said image on a display unit.

16. (original) The network attachable display device of claim 15, further comprising a display network interface port coupled to said network attachable display controller, said graphics data being received over said communication network via said display network interface port.

17. (original) The network attachable display device of claim 16, wherein said display network interface port comprises an Infiniband port.

18. (original) The network attachable display device of claim 15, said display decompression unit being operable to decompress said graphics image data into decompressed graphics image data prior to being stored in said display frame buffer.

19. (original) The network attachable display device of claim 15, said graphics image data being part of a plurality of packets received from a remote source device.

20. (original) The network attachable display device of claim 19, wherein said remote source device is a graphics adapter.

21. (original) The network attachable display device of claim 15, said display decompression unit being operable to decompress said graphics image data at a rate at least as fast as a rate at which said image is being displayed on said display unit.

22. (original) The network attachable display device of claim 15, wherein said display unit comprises an element selected from the group consisting of a Cathode Ray Tube (CRT), a Liquid Crystal Display (LCD), a Thin Film Transistor (TFT), a Light Emitting Diode (LED), and an organic polymer.

23. (new) A network attachable display device, comprising:
a display network interface operable to receive rendered graphics image data of an image over a communication network;
a display frame buffer operable to store said received rendered graphics image data;
and
a display refresh unit operable to read said rendered graphics image data from said display frame buffer, said display refresh unit further operable to display said image on a display unit.

24. (new) The network attachable display device of claim 23, further comprising a display network interface port coupled to said display network interface, said rendered graphics image data being received over said communication network via said display network interface port.

25. (new) The network attachable display device of claim 24, wherein said display network interface port is selected from the group consisting of an Ethernet port, an Infiniband port, and a wireless network transceiver.

26. (new) The network attachable display device of claim 23, further comprising a display decompression unit coupled to said display frame buffer and operable to decompress said rendered graphics image data into decompressed rendered graphics image data.

27. (new) The network attachable display device of claim 23, further comprising a display decompression unit operable to decompress said rendered graphics image data into decompressed rendered graphics image data prior to being stored in said display frame buffer.

28. (new) The network attachable display device of claim 23, said rendered graphics image data being part of a plurality of packets received from a remote source device.

29. (new) The network attachable display device of claim 28, wherein said remote source device is a graphics adapter.

30. (new) The network attachable display device of claim 28, wherein said remote source device is a graphics appliance.

31. (new) A method for displaying an image on a network attachable display device, comprising:

receiving, by a display network interface of said network attachable display device, rendered graphics image data of said image over a communication network;

storing said received rendered graphics image data in a display frame buffer of said network attachable display device;

reading said stored rendered graphics image data from said display frame buffer by a display refresh unit; and

displaying said image on a display unit.

32. (new) The method of Claim 31, further comprising decompressing said rendered graphics image data.

33. (new) The method of claim 32, further comprising storing said decompressed rendered graphics image data in said display frame buffer.

34. (new) The method of claim 33, further comprising storing said rendered graphics image data and said decompressed rendered graphics image data in different portions of said display frame buffer.

35. (new) The method of claim 31, further comprising decompressing said rendered graphics image data into decompressed rendered graphics image data prior to storing said rendered graphics image data in said display frame buffer.

36. (new) The method of claim 35, wherein decompressing comprises decompressing said rendered graphics image data at a rate at least as fast as a rate at which said image is being displayed on said display unit.
